Preface

Overview

This document presents the steps and guides for rapid verification and development of large language models and visual large models.

Product Version

SoC	Kernel Version
RV1126B	Kernel 6.1

Target Audience

This document (this guide) is mainly intended for:

Technical support engineers

Software development engineers

Rockchip RKAI Developer Guide

1. Introduction
2. Quick Verification
 - 2.1 Quick Verification of LLM
 - 2.2 VLM Rapid Verification
3. Custom Models
4. Detailed API Documentation
 - 4.1 LLM API
 - 4.2 VLM API

1. Introduction

The RKAI module is a rapid verification module and adaptation example for SDK integration with Large Language Models (LLM) and Vision Language Models (VLM). The source code of this module is open-source and can be found at the path: `app/rkai`. The directory structure is as follows:

```
tree rkai -L 1
rkai
├── app_conf #Configuration files and model files
├── CMakeLists.txt
├── common #General code
├── LICENSE
├── README.md
├── rkai_LLM # LLM model API source code
├── rkai_VLM # VLM model API source code
└── samples # Adaptation use cases

5 directories, 3 files
```

- `app_conf` is the general configuration path, which includes three parts: model files, model configuration files, and model input files. This part can be directly integrated into the board for use.
- `common` contains general code for the RKAI module, such as `CNPY`, etc.;
- `rkai_LLM` is the general API for LLM deployment;
- `rkai_VLM` is the general API for VLM deployment;
- `samples` provide verification cases for LLM/Vision/VLM.

2. Quick Verification

The SDK comes with the RKAI module pre-compiled by default and integrates the `Qwen3-0.6B` model, allowing users to quickly verify the process of large models.

2.1 Quick Verification of LLM

The LLM adaptation program is `rkai_LLM_Demo`, with the following Usage:

```
Usage: rkai_LLM_Demo [options]
Options:
  --llm_model <path>    RKLLM model file
  --config <path>       Configuration ini file
Example:
  rkai_LLM_Demo --llm_model /usr/share/app_config/models/Qwen3-
0.6B_W4A16_RV1126B.rkllm --config rkai_config.ini
```

The default inference command is:

```
rkai_LLM_Demo --config rkai_config.ini
```

The program comes with 4 pre-set questions, from which users can select by entering numbers, or input questions directly through the terminal.

```
*****Enter the corresponding number for the following questions
to get answers/ or input custom questions*****
[0] Translate the following modern text into classical Chinese: When the spring
breeze is gentle and the sun is bright...
[1] Write an ancient poem with the theme of "Ode to Plum Blossoms", including
elements such as plum blossoms and snow.
[2] Upper couplet: Used to watch thousands of sails pass by the riverbank
[3] Translate this sentence into Chinese: Knowledge can be acquired from many
sources...
[4] Translate this sentence into English: RK3588是新一代高端处理器...

*****
```

The model output consists of two parts: 1. Model response; 2. Performance.

```
user: 0
把下面的现代文翻译成文言文：到了春风和煦，阳光明媚的时候...
I rkllm: reset chat template:
I rkllm: system_prompt: <|im_start|>system\nYou are a helpful assistant.<|im_end|>\n
I rkllm: prompt_prefix: <|im_start|>user\n
I rkllm: prompt_postfix: <|im_end|>\n<|im_start|>assistant\n
I rkllm: Calling rkllm_set_chat_template will disable the internal automatic chat template parsing, including enable_thinking. Make sure your custom prompt is complete and valid.
robot: <think>
好的，用户让我把“到了春风和煦，阳光明媚的时候”翻译成文言。首先，我需要理解原句的意思。这句话描述的是春天的天气，特别是温暖的气候，可能用来描绘一个美好的季节。
接下来，我得考虑文言文的特点。文言文讲究用词准确、意象丰富，所以每个词都要有其特定的含义。比如“到”在文言中常表示时间或地点的到达，而“春风”和“阳光”都是自然景象，需要找到合适的词汇来表达。
然后，我需要确定翻译的结构。通常，
+-----+
| Stage | Perf |
+-----+
| TFFT | 334.659 (ms) |
| TPS | 14.117 (tokens/s) |
+-----+
```

You can also convert the model yourself and use `rkai_LLM_Demo` for model inference verification. Detailed instructions are in the third section.

2.2 VLM Rapid Verification

VLM actually refers to Vision and LLM, which can be verified separately or together. Due to the large memory footprint of the models, it is not convenient to integrate them into the SDK. Therefore, users can quickly verify the VLM model by downloading from the following URLs.

The Vision model download link is: [Vision Model](#);

The LLM download link is: [LLM Model](#).

Push the downloaded models to the board's `app_config/models` directory. Then, you can use `raki_VLM_Demo` for rapid verification. Usage is as follows:

```
Usage: rkai_VLM_Demo [options]
Options:
  --vision_model <path>    Vision RKNN model file
  --llm_model    <path>    LLM RKLLM model file
  --image_path   <path>    Input image file
  --config       <path>    Configuration ini file
Example:
  ./rkai_VLM_Demo --vision_model fastvlm-0.5b-fp16.rv1126b.rknn --llm_model
fastvlm-0.5B-w8a8_level0.rv1126b.rkllm --image_path image.jpg --config
rkai_config.ini
```

If the downloaded models are pushed to the `app_conf/models` path, then you can use the following command for inference:

```
rkai_VLM_Demo --config rkai_config.ini
```

If the downloaded models are pushed to other paths, then you need to manually specify:

```
rkai_VLM_Demo --vision_model xxx.rknn --llm_model xxx.rkllm --config rkai_cfg.ini
```

The model output consists of two parts: 1. Model response; 2. Performance.

```
user: <image>tell me what is in the image?
rkllm: reset chat template:
rkllm: system_prompt: <im_start>system\nYou are a helpful assistant.<im_end>\n
rkllm: prompt_prefix: <im_start>user\n
rkllm: prompt_postfix: <im_end>\n<im_start>assistant\n
rkllm: Calling rkllm_set_chat_template will disable the internal automatic chat template parsing, including enable_thinking. Make sure your custom prompt is complete and valid.
user: <image>tell me what is in the image?
robot: In the image, there is an astronaut on the moon with his legs crossed and holding a green bottle. He is wearing a white space suit and is sitting next to a green cooler. In the background, there is a large planet visible in the sky.
-----
| Stage | Perf |
-----
| Vision | 2621 (ms) |
| TTFT | 1642.638 (ms) |
| TPS | 13.447 (tokens/s) |
-----
```

3. Custom Models

Users can convert models on their own and perform inference using `rkai_LLM_Demo` and `rkai_VLM_Demo`. The model conversion tool download link is: <https://github.com/airockchip/rknn-llm>. If users customize their models, then `rkai_cfg.ini` needs to be modified accordingly.

1. In `rkai_cfg.ini`, the `[llm_cfg]` section contains LLM parameters, including model hyperparameters that users can adjust. The parameters are as follows:

Parameter	Default Value	Description
llm_model	models/Qwen3-0.6B_W4A16_RV1126B.rkllm	Can be defined externally with <code>--llm_model</code>
max_context_len	1024	Maximum context length
max_new_tokens	128	Maximum output tokens
skip_special_token	1	Whether to skip special characters
base_domain_id	0	Memory usage method, default is 0
top_k	1	Less than or equal to 1

2. In `rkai_cfg.ini`, the `[vlm_cfg]` section contains VLM parameters, including model hyperparameters that users can adjust. The parameters are as follows:

Parameter	Default Value	Description
vision_model	models/fastvlm-0.5b-fp16.rv1126b.rknn	Can also be defined externally with <code>--vision_model</code>
llm_model	models/fastvlm-0.5B-w8a8_level0.rv1126b.rkllm	Can be defined externally with <code>--llm_model</code>
image_path	inputs/image_1024x1204.npy	Supports input jpg images, specified with <code>-image_path</code>
max_context_len	512	Maximum context length
skip_special_token	1	Whether to skip special characters
base_domain_id	0	Memory usage method, default is 0
top_k	1	Less than or equal to 1

3. In `rkai_cfg.ini`, the `[prompt]` section is the system prompt, and users need to modify this part when customizing their models. The parameters are as follows:

Parameter	Default Value	Description
system_prompt	< im_start >system\nYou are a helpful assistant.< im_end >\n	Default system prompt for qwen3
prompt_prefix	< im_start >user\n	Can be obtained from the model's config file
prompt_postfix	< im_end >\n< im_start >assistant\n	Can be obtained from the model's config file

4. In `rkai_cfg.ini`, the [tensor] section is the image placeholder for the VLM model, and users need to modify this part when customizing their models. The parameters are as follows:

Parameter	Default Value	Description
img_start	< im_start >	Image placeholder, can be obtained in the model config
img_end	< im_end >	Image placeholder, can be obtained in the model config
img_content	< im_content >	Image placeholder, can be obtained in the model config

4. Detailed API Documentation

Users can integrate applications by calling APIs themselves. The APIs are fully open-source, and the following will introduce the APIs.

4.1 LLM API

The APIs for initializing and deinitializing the LLM model are as follows:

API	rkai_llm_init
Description	LLM Initialization
Parameters	rkaiCtxLLM* ctx: LLM handle
	rkaiCfg* cfg: LLM parameter configuration

API	rkai_llm_release
Description	LLM Deinitialization

The APIs for LLM inference deployment are as follows:

API	rkai_llm_run
Description	LLM Inference
Parameters	rkaiCtxLLM* ctx: LLM handle
	rkaiCfg* cfg: LLM parameter configuration

4.2 VLM API

VLM's Vision Model API:

API	rkai_vlm_vision_init
Description	Vision Initialization
Parameters	const char *model_path: Vision model path, in .rknn format
	rkaiCfg* cfg : LLM parameter configuration

API	rkai_vlm_vision_release
Description	Vision De-initialization

APIs for Vision Inference are as follows:

API	rkai_vlm_vision_run
Description	LLM Inference
Parameters	rkaiCtxVision *rkai_ctx: Handle
	void *img_data: Input image buffer, in rgb888 format
	rkaiVisionToLLM *vtol: Parameters and buffer for vision to llm

API	dump_tensor_attr
Description	Dump basic information of the model
Parameters	rknn_tensor_attr *attr: Model tensor information
	int32_t is_inputs: Whether to dump inputs

VLM's LLM API:

API	rkai_vlm_llm_init
Description	LLM Initialization
Parameters	rkaiCtxLLM* ctx: LLM handle
	rkaiCfg* cfg :LLM parameter configuration

API	rkai_vlm_llm_release
Description	LLM De-initialization

APIs for LLM Inference Deployment are as follows:

API	rkai_vlm_llm_run
Description	LLM Inference
Parameters	rkaiCtxLLM* ctx: LLM handle
	rkaiCfg* cfg :LLM parameter configuration
	rkaiVisionToLLM *vtl: Receive information from Vison
